

1 ABSTRACT OF THE INVENTION
2

3 The present invention provides a method for keeping a file system in a
4 consistent state and for creating read-only copies of a file system. Changes to
5 the file system are tightly controlled. The file system progresses from one self-
6 consistent state to another self-consistent state. The set of self-consistent blocks
7 on disk that is rooted by the root inode is referred to as a consistency point. To
8 implement consistency points, new data is written to unallocated blocks on disk.
9 A new consistency point occurs when the fsinfo block is updated by writing a new
10 root inode for the inode file into it. Thus, as long as the root inode is not updated,
11 the state of the file system represented on disk does not change. The present
12 invention also creates snapshots that are read-only copies of the file system. A
13 snapshot uses no disk space when it is initially created. It is designed so that
14 many different snapshots can be created for the same file system. Unlike prior
15 art file systems that create a clone by duplicating the entire inode file and all of
16 the indirect blocks, the present invention duplicates only the inode that describes
17 the inode file. A multi-bit free-block map file is used to prevent data from being
18 overwritten on disk.
